Relative impact of diagnosis and clinical stage on response to electroconvulsive therapy: a retrospective cohort – Tedeschi E et al.

Box S1 Definition of stages according to McGorry et al. (9)

0	Increased risk of psychotic or severe mood disorder but asymptomatic
Ia	Mild or non-specific symptoms (including subtle neurocognitive deficits) of psychosis or severe mood disorder. Mild functional change or decline
Ib	Ultra-high risk: moderate but subthreshold symptoms, with neurocognitive changes and functional decline to caseness
II	First episode of psychotic or severe mood disorder with moderate to severe symptoms, neurocognitive deficits and functional decline
IIIa	Incomplete remission from discrete disorder
IIIb	Recurrence or relapse of psychotic or mood disorder after full recovery
IIIc	Multiple relapses with worsening in clinical extent and impact of illness objectively present
IV	Severe, persistent or unremitting illness as judged by symptoms, neurocognition and disability criteria
